-:- SUBCELLULAR LOCATION: CHLOROPLAST (PROBABLE).
-:- TISSUE SPECIFICITY: ABUNDANT IN LEAVES AND ROOTS.
-:- HISCELLANEOUS: IN PLANTS, THERE ARE TWO FORMS OF THIS ENZYME, ONE CYTOSOLIC AND THE OTHER CHLOROPLASTIC.

Narbertlication of the Bradyrhizobium japonicum degp gene as pair

"Identification of the Bradyrhizobium japonicum degp gene as pair

an operon containing small heat shock protein genes.";

Submitted (NOV-1997) to the EMBL/GenBank/DDBJ detabases.

-: SIMILARITY: BELONGS TO THE SMALL HEAT SHOCK PROTEIN (HSP20)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -1- COFACTOR: NICKEL (BY SIMILARITY).
-1- PATHWAY: HYDROGEN METABOLISM; FHL PATHWAY (BY SIMILARITY).
-1- SUBUNT: FHL COMPRISES OF A FORMATE DEHYDROGENASE, UNIDENTIFIED ELECTRON CARRIERS AND A HYDROGENASE (ISOENZYME 3). IN THIS NON-FONEMY CONSERVING PATHWAY MOLECULAR HYDROGEN AND CARBODIOXIDE FROM FORMATE ARE RELEASED (BY SIMILARITY).
-1- SIMILARITY: BELONGS TO THE COMPLEX I 49 KDA SUBUNIT FAMILY.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAR89734 represents the generic formula of this newly defined class of labelled peptides. C5a antagonists identified using this method are useful in the treatment of a wide variety of C5a-mediated diseases such as acute respiratory distress syndrome (ARDS), anaphylactic shock, psoriasis, osteoarthritis, rheumatoid arthritis, asthma, cardiovascular disorders, and metastatic spread of cancerous tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Castro-intestinal transport receptor; bindiny protein; hSI; HPPI; pDIII hepPI; human; GI Lrack receptor; sucrose-isomaliase complex; intestinal peptide-associated transporter; hyperlension; diabetes; osteoporosis; haemophilia; anaemia; cancer; migralne; angina pectoris;

This sequence represents a peptide that specifically binds to the human 1924 protein. The invention relates to purified proteins (1) that bind specifically to at least one of the gasto-intestinal (6) tract creeptors human intestinal peptide associated transporter (HPT).

Treeptors human sucrose-isomaltase complex (hSI). (1) provide active transport of therapeutic agents through human and animal GI tissue (1 into the blood) for in vivo delivery, particularly for treatment or prevention of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, imajraine, or amijna pectoris. Specifically thry are used to deliver insulin or leuprolide, but many other suitable therapeutic agents are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (1) may also provide targeting to the GI tract. Other uses of (1) are: (1) to determine the level of specified receptors in a sample (1) are: (1) to determine the level of specified receptors in a sample (1) are: (1) to many other suitable therapeutic analogues or derivatives of (1) are used to raise antibodies and in immunoassays. The antibodies are used to locate, detect and measure (1), e.g. for imaging mondification.

Polynucleotide encoding plant lecithin; cholesterol acyltransferase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries

Claim 10; Page 40-41; 49pp; English.

```
The present sequence is a putative protein sequence of a corn lecitlinicholesterol acyltransferase (also known as phosphalidylcholine-sterol 0-acyltransferase). This enzyme is found associated with high-density lipoproteins and Apolipoprotein-Al and -D.

The invention relates to a novel yeast G protein-coupled receptor, C GPRI (AAY\$835). GPRI is predicted to have seven transmembrane domains, which is characteristic of G protein-coupled receptors, and also contains a very large third cytoplasmic loop and a large cytoplasmic tail. The third cytoplasmic loop contains two short basic sequences; one sequence (KRKRAOIG) is present at the N-terminal end of the loop and the chird cytoplasmic loop also contains an asparagine-rich region. GPRI is believed to provide the upstream signal that activates GPR2, and plays an essential role in inducting the switch from hor-filamentous to filamentous growth in yeast. Modulators of GPRI function, especially inhibitors, are useful for prevention or treatment of a disease or disorder involving a fungal infection. The inhibitor may be an anti-GPRI antibody, GPRI antisense nucleic acid or a GPRI quee altered so that an inserted heterologous sequence inactivates the biological activity of GPRI. Compounds which modulate GPRI gene expression and/or gene product activity may be used to inhibit the conversion of a fungus from a non-filamentous form to a filamentous form. The present sequence in the conversion of a fungus from a non-filamentous form to a filamentous form. The present sequence ö the invention. This sequence is lacking the majority of the cytoplasmic Creaminal tail, relative to the native GPRI. Note: This sequence is not shown in the specification, but is derived from the yeast GPRI amino acid sequence given in figure 1A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel yeast C protein-coupled receptor, GPR1 (AAY58355). GPR1 is predicted to have seven transmembrane domains, which is characteristic of G protein-coupled receptors, and also contains a very large third cytoplasmic loop and a large cytoplasmic tail. The third cytoplasmic loop contains two short basic sequences; one sequence (KRIKAQIG) is present at the N-terminal end of the loop and the other sequence (KKRRAQIO) is at the C terminal end of the loop. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      third cytoplasmic loop also contains an asparagine rich region. GPRI is believed to provide the upstream signal that activates GPA2, and plays an assential role in inducing the switch from non-filamentous to filamentous growth in yeas. Modulators of GPRI function, especially inhibitors, are useful for prevention or treatment of a disease or disorder involving a fungal infection. The inhibitor may be an anti-GPRI antibody, GPRI antisense nucleic acid or a GPRI gene altered so that an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inserted heterologous sequence inactivates the biological activity of GPR1. Compounds which modulate GPR1 gene expression and/or gene product activity may be used to inhibit the conversion of a fungus from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: This sequence is not shown in the specification, but is derived from the yeast GPRI amino acid sequence given in figure 1A.
                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              represents a GPR mutant, d277-284, used in an exemplification of
the invention. This sequence is lacking a portion (designated the
SmaRest region) of the cytoplasmic C-terminal tail, relative to the
                                                                                                                                                                                                                                                                                                                                                                                                                                  Yeast; G protein-coupled receptor; GPR1; filamentous growth; pseudohyphal form; signalling pathway; antifungal; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                non-filamentous form to a filamentous form. The invention relates to a novel yeast G protein-coupled receptor.

CPRI (AAY$835). GPRI is predicted to have seven transmembrane domains, which is characteristic of G protein-coupled receptors, and also contains a very large third cytoplasmic loop and a large cytoplasmic sequences. The third cytoplasmic loop contains two short basic sequences: one sequence (KRKRAOIG) is present at the Y-terminal end of the loop and the other sequence (KRRRAOIG) is at the G-terminal end of the loop and the other sequence (KRRRAOIG) is at the G-terminal end of the loop. The third cytoplasmic loop also contains an asparagine-rich rogion. GPRI is believed to provide the upstream signal that activates GPA2, and plays an essential role in inducing the switch from non-filamentous to tilamentous growth in yeast. Modulators of GPRI function, especially inhibitors, are useful for prevention or treatment of a disease or disorder involving a fundal infection. The inhibitor may be an anti-GPRI antiscnsc nucleic acid or a GPRI genc altered so that an inserted heterologous sequence inactivates the biological activity of GPRI. Compounds which modulate GPRI genc expression and/or gene product activity may be used to inhibit the conversion of a fundus from a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    represents a CPR mulant, d277-284, used in an exemplification of the invention. This sequence is lacking the asparagine-rich region of the third cytoplasmic loop, relative to the native GPRI. Note: This sequence is not shown in the specification, but is derived from the yeast GPRI amino acid sequence given in figure IA.

contains a very large third cytopeamic loop and a large cytoplasmic contains a very large third cytopeamic loop and a large cytoplasmic contains two short basic sequences: one sequence (KRRAQIO) is present at the N-terminal end of the loop and the other sequence (KRRAQIO) is at the C-terminal end of the loop and the chird cytoplasmic loop also contains an asparagine-rich region. GPRI is believed to provide the upstream signal that activates GPA2 and plays an essential role in inducing the switch from non-filamentous to sequence in inducing the switch from non-filamentous countries. Modulators of GPRI function, especially inhibitors, are useful for prevention or treatment of a disease or disnoible involving a fungal infection. The inhibitor may be an anti-GPRI intended, GPRI antisease uncleic acid or a GPRI gene altered so that an inserted heterologous sequence inactivates the biological activity of size compounds which modulate GPRI gene expression and/or gene product activity may be used to inhibit the conversion of a fungus from a non-filamentous form to a filamentous form. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a movel yeast G protein-coupled receptor, C CPRI (AAYS035). GPRI is predicted to have seven transmembrane domains, which is characteristic of G protein-coupled receptors, and also contains a very large third cytoplasmic loop and a large cytoplasmic loop contains two short basic sequences; one sequence (KRIKAOIG) is present at the N-terminal end of the loop and the collect sequence (KRIKAOIG) is at the C-terminal end of the loop and the third cytoplasmic loop as contains an asparagine-rich region. GPRI is believed to provide the upstream signal that activates GPA2, and plays an essential role in inducing the switch from non-filamentous to filamentous growth in yeast. Modulators of GPRI function, especially inhibitors, are useful for prevention or trealment of a disease or disorder involving a fungal infection. The inhibitor may be an anti-GPRI antibacky, GPRI antisense muchaics acid or a GPRI gene altered so that an inserted hoteerologous sequence inactivates the biological activity of contility may be used to inhibit the conversion of a fungus from a conversion of a fungus from a conversion of a fungus from a

                                                                                                    This sequence represents a novel yeast G protein coupled receptor,

GPRI, GPRI is predicted to have seven transmembrane domains,
which is characteristic of G protein coupled receptors, and also
contains a Very large thic cytoplasmic loop and a large cytoplasmic

Lail. The third cytoplasmic loop contains two short basic sequences; one
sequence (KRRRAOIO) is present at the N-terminal end of the loop and the
other sequence (KRRRAOIO) is at the C-terminal end of the loop and the
cother sequence (KRRRAOIO) is at the C-terminal end of the loop. The
third cytoplasmic loop also contains an asparagine-rich region. GPRI is
believed to provide the upstream signal that activates GPA2 and plays
an essential role in inducing the switch from non-filamentous to
filamentous growth in yeast. Modulalors of GPRI function, especially
inhibitors, are useful for prevention or treatment of a disease or
disorder involving a fungal infection. The inhibitor may be an anti-GPRI
antibody, GPRI antisense nucleic acid or a GPRI gene altered so that an
inserted heterologous sequence inactivates the biological activity of
cPRI. Compounds which modulate GPRI gene expression and/or gene product
cother sequence involving a contained to inhibit the conversion of a fungus from a
                                                                                                                                                                                                                                                                                                                                                                                            ö

comprises a rucleic acid sequence corresponding to the 5' Lerminal comprises a rucleic acid sequence corresponding to the 5' Lerminal end of the genome of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the productions copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic Nuv (Newcastle Discase virus) of a production of exagenous proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the viral discase of a production of exagenous proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the viral discase. Now can be easily cultured a stable form of a vaccine, especially adainst.

Crespiratory and/or gastrointestinal diseases. Now can be easily cultured an order of superior is relatively definite steed by mass application methods e.g. drinking water or he expraying or by aerosol formation. The natural route of infection is by an erosity formation. The natural route are also the major
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New avian paramyxovirus cDNA, useful for production of vaccine against

routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. This sequence represents a protein encoded by the NDV strain LaSota genome which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 called human colon cancer antigens, given in AAB3324 to AAB5406. The human colon cancer antigens, given in AAB3324 to AAB54066. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprolective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antinfective and antibacterial activities, and proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosts to the proteins are useful for the prevention, treatment and diagnosts of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent discases such as neural disorders, immuno

the specification. The primer sets can be used in an issense therapy and in gene therapy. The primer sets can be used in an issense therapy and in gene therapy. The primers are useful for synthesising polynucleolides, particularly full-length const. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length const. The primers allow obtaining of the full-length const. The primers allow obtaining of the full-length const. Anil 3538 and AAII 3633 to AAII 3642 represent human const sequences; AAB92446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yamamoto J;
